An annotated list of 26 species of *Colletes* collected in Mongolia by Soviet-Mongolian expeditions in 1967–1982 is given. Two species, *Colletes perforator* Smith, 1869 and *C. pauljohni* Kuhlmann, 2002 are newly recorded from Mongolia. An updated checklist of the 34 species of *Colletes* so far known from Mongolia is provided.

KEY WORDS. Bees, Apoidea, Apiformes, Palaearctic region, biodiversity, new records.

Приводится список 26 видов пчел из рода *Colletes*, собранных в Монголии в результате Советско-Монгольских экспедиций в 1967–1982 гг. и хранящихся в Зоологическом институте РАН, Санкт-Петербург. Из них два вида: *Colletes perforator* Smith, 1869 и *C. pauljohni* Kuhlmann, 2002 указываются впервые для

фауны Монголии. Дан уточненный список *Colletes* Монголии, насчитывающий 34 вида.

INTRODUCTION

Mongolia is located in central Asia, bordered by Russia to the north and China in the south. It is the sixth largest country in Asia, covering 1,564,100 sq. km and is divided into 21 provinces called “aimags” (Fig. 1).

Fig. 1. Administrative map of Mongolia showing provinces (aimags) (from Kuhlmann & Proshchalykin, 2013a).

Soviet-Mongolian expeditions were conducted from 1967 to 1983 and collected extensive entomological material, which became the basis for the publication of numerous articles and books (including *Insects of Mongolia* in 11 volumes), devoted to the study of various insect families. However, taxonomic information about the Mongolian bee fauna is still fragmentary. Based on the material collected by these expeditions only four papers on Halictidae bees have been published (Pesenko, 1977, 1984a,b; Astafurova & Proshchalykin, 2015). In 2014 previously unstudied *Colletes* specimens collected by the Soviet-Mongolian expeditions were discovered in the Zoological Institute, Russian Academy of Sciences, St. Petersburg (ZISP) that complement previous studies (Kuhlmann & Dorn, 2002; Kuhlmann, 2009a; Kuhlmann & Proshchalykin, 2013a).

The results presented in this paper are based on 558 specimens collected by M.A. Kozlov (357 specimens), E.P. Narchuk (78), I.M. Kerzhner (63), E.S. Sugonyaev (44), V.F. Zaitsev (10), D. Myagmarsuren (3), E.L. Gur'eva (2), and G.S. Medvedev (1) in Mongolia during the eleven Soviet-Mongolian expeditions (1967–1971, 1973, 1975, 1976, 1978, 1980, 1982), that are currently housed in ZISP (Table 1).

Places and dates of collecting bees in Mongolia follows Emeljanov *et al.* (1968, 1973, 1977, 1978) and Kerzhner *et al.* (1982). Hard brackets are used when information is added to specimen label information (e.g. geographical coordinates) or published data (e.g. current name of an old place name; affiliation to a present day country).

In the present study we report additional records of 26 *Colletes* species with two species recorded from Mongolia for the first time. In total 34 *Colletes* species are now recorded from Mongolia (Table 2) with its centre of diversity in the South-West of the country (Fig. 2). *Colletes conradti* Noskiewicz, 1936 is removed from the list of Mongolian species (see Proshchalykin & Kuhlmann, 2015 for details).

We have used the following abbreviations for collectors: DM – D. Myagmarsuren, EG – E.L. Gur’eva, EN – E.P. Narchuk; ES – E.S. Sugonyaev; GM – G.S. Medvedev, IK – I.M. Kerzhner; MK – M.A. Kozlov. New distribution records are marked with an asterisk (*). The general distribution of *Colletes* follows Kuhlmann & Proshchalykin (2013a,b; 2014a,b), Proshchalykin & Kuhlmann (2015), and Niu *et al.* (2014). The definition of *Colletes* species-groups follows Noskiewicz (1936) and Kuhlmann *et al.* (2009).
