An annotated list of fifty two species in seven subfamilies of Pteromalidae is given. Twenty eight species are recorded for the first time for the fauna of Russia, and twenty species are new for the fauna of the Russian Far East. A new data on the distribution of four species (*Dipara belokobylskii*, *Diconocara petiolata*, *Golovissima emeljanovi*, *Paracarotomus cephalotes*) in the Russian Far East are given.

KEY WORDS: Pteromalidae, Hymenoptera, Chalcidoidea, first record, Russian Far East.

INTRODUCTION

Parasitic wasps of the family Pteromalidae are one of the numerous and economically important groups of parasitoids, but our knowledge of this group in the fauna of the Russian Far East is reduced. Hitherto only 42 species of 29 genera belonging to eight subfamilies were recorded from this region (Swederus, 1795; Walker, 1874; Nikolskaya, 1952; Chumakova, 1956; Graham, 1969; Pilipyuk, 1971; Arefin, 1974; Herting, 1976; Kamijo, 1981a, 1981b, 1982a, 1982b, 1983; Dzhankmen, 1978, 1982, 1984, 1986, 1993; Gibson, Vikberg, 1998; Tselikh, 2010; Noyes, 2011).

The present study is based on examination of the material from collections of the Zoological Institute RAS (St. Petersburg), Institute of Biology and Soil Science RAS (Vladivostok) and I.I. Schmalhausen Institute of Zoology NAS (Kiev). As a result, the faunistic list of Pteromalidae of the Russian Far East is increased on 48 species and contain now 90 species.

The next abbreviations are used for the collectors of material: SB – S.A. Belokobylskij; AL – A.S. Lelej; DK – D.R. Kasparyan. Species record for the first time for the fauna of Russia are marked by asterisk (*), for the Russian Far East by double asterisks (**).

DISCUSSION

As a result of the collection material study and summation of the literature data, the list of Pteromalidae wasps distributed in the Russian Far East includes 90 species from 56 genera and 10 subfamilies: Asaphinae (3 species), Cleonyminae (1 species), Colotrechninae (1 species), Diparinae (1 species), Elatoidinae (2 species), Eunotinae (2 species), Miscogasterinae (12 species), Ormocerinae (1 species), Pireninae (2 species), Pteromalinae (65 species).

Twenty eight species from five subfamilies are recorded for the first time for the fauna of Russia: *Cleonymus longinervus* (Cleonyminae), *Colotrechnus viridis* (Colotrechninae), *Eunotus parvulus* (Eunotinae), *Halticoptera collaris*, *H. violacea*, *Merismus megapterus*, *Stictomischus nitentis*, *S. scaposus*, *Thektogaster chrysis* (Miscogasterinae), *Chlorocyclus comatus*, *C. planus*, *Dinarmus acutus*, *Gastracanthus acutus*, *Holcaeus stylatus*, *Homoporus apharetus*, *Janssoniella caudate*, *Merismus flagellatus*, *Mesopolobus mediterraneus*, *Plutothrix trifasciata*, *Pteromalus cardui*, *Sphegigaster nigricornis*, *S. truncata*, *Syntomopus thoracicus*, *Trichomalopsis apanteloctena*, *T. deplanata*, *T. oryzae*, *T. pulcher*, *Usubaia liparae* (Pteromalinae). Besides this, twenty species of pteromalids are recorded for the first time for the fauna of Russian Far East.

A new data on the distribution of four species in the Russian Far East are supplemented: *Dipara belokobylskii* – Kuril Islands (Kunashir), *Diconocara petiolata*, *Golovissima emeljanovi* and *Paracarotomus cephalotes* – Amurskaya oblast.
